

# 3CE Batch Classifier. Build Capacity.

Developed as a practical approach to classifying large product databases, the 3CE Batch Classifier processes records from any common data output format (e.g. xls, xml, csv, txt, etc.). The tool reads the narrative product information and assigns HS codes automatically. When goods descriptions are not detailed enough for automatic HS classification, the Batch Classifier identifies them as exceptions, identifies the missing product attribute, and provides a link to the Classification Assistance Tool so that the user can complete the transaction seamlessly and immediately.

The 3CE Batch Classifier includes KPI reporting, and is available as either a stand-alone solution or as an integrated component of ERP and GTM systems.

**“The historical barriers to entry (size and infrastructure) are diminishing in importance. The emphasis now is based on speed rather than size”.**

- Industry Canada

## INFERENCE RULES

### MAXIMIZE AUTOMATION

The 3CE Classification Assistance tool also allows users to create and save inference rules, which can be used to further automate the automatic assignment of HS codes. When used in combination with the 3CE Batch Classifier, records that would not otherwise be classifiable because of missing product information can be classified automatically. In many cases, more than 80% automatic classification is achieved.
